

Syntax Color: Utilities

Version 8.13.0.9

Scott Owens

July 1, 2024

The "syntax-color" collection provides the underlying data structures and some helpful utilities for the `color:text<%>` class of `framework`.

Contents

1	Parenthesis Matching	3
2	Lexer Contract and The Don't-Stop Structure Type	4
3	Racket Lexer	6
4	Default Lexer	9
5	Module Lexer	10
6	Scribble Lexer	13
7	Splay Tree for Tokenization	15
8	Interface for Clients of Syntax Color Output	17
9	Racket S-Expression Indentation and Navigation	20
9.1	S-Expression Navigation	20
9.2	S-Expression Indentation	21

1 Parenthesis Matching

```
(require syntax-color/paren-tree)
      package: syntax-color-lib
```

```
paren-tree% : class?
  superclass: object%
```

Parenthesis matching code built on top of `token-tree%`.

2 Lexer Contract and The Don't-Stop Structure Type

```
(require syntax-color/lexer-contract)
package: syntax-color-lib
```

`lexer/c` : `contract?`

Checks to be sure a lexing function is well-behaved, constrained to functions where the second return value is a symbol. For more details, see `start-colorer` in `color:text<%>`.

`lexer*/c` : `contract?`

Checks to be sure a lexing function is well-behaved. For more details, see `start-colorer` in `color:text<%>`.

It also supplies a few random arguments to the lexer and checks the results, using `option/c`'s `#:tester` argument.

Added in version 1.2 of package `syntax-color-lib`.

`lexer*/c-without-random-testing` : `contract?`

The same contract as `lexer*/c`, except without the random testing.

```
(struct dont-stop (val))
  val : any/c
```

A structure type used to indicate to the lexer that it should not allow itself to be interrupted. For more details, see `start-colorer` in `color:text<%>`.

```
(check-colorer-results-match-port-before-and-afters
  who
  type
  pos-before
  new-token-start
  new-token-end
  pos-after)
→ void?
  who : symbol?
  type : any/c
  pos-before : (or/c exact-positive-integer? #f)
  new-token-start : (or/c exact-positive-integer? #f)
  new-token-end : (or/c exact-positive-integer? #f)
  pos-after : (or/c exact-positive-integer? #f)
```

Checks that the results of a colorer make sense with respect to the positions of the port, before and after the lexer is called.

The *pos-before* argument is expected to be the third result of `port-next-location` before a lexer is called and the *pos-after* argument is expected to be the third result of `port-next-location` after the lexer is called. The *type*, *token-start*, and *token-end* arguments should be the corresponding results from the colorer (c.f. `start-colorer`).

This function raises an error unless the following boolean expression is true:

```
(or (equal? type 'eof)
    (and (= pos-before new-token-start)
         (< new-token-start new-token-end)
         (= new-token-end pos-after)))
```

but it checks the individual parts of the expression to raise a more meaningful error message when some part is not true.

The *who* argument is used to start the error message.

Added in version 1.4 of package `syntax-color-lib`.

3 Racket Lexer

```
(require syntax-color/racket-lexer)
package: syntax-color-lib

(racket-lexer in) → (or/c string? eof-object?)
                   symbol?
                   (or/c symbol? #f)
                   (or/c number? #f)
                   (or/c number? #f)

in : input-port?
```

A lexer for Racket, including reader extensions (§13.7 “Reader Extension”), built specifically for `color:text<%>`.

The `racket-lexer` function returns 5 values:

- Either a string containing the matching text or the eof object. Block comments and specials currently return an empty string. This may change in the future to other string or non-string data.
- A symbol in `'(error comment sexp-comment white-space constant string no-color parenthesis hash-colon-keyword symbol eof other)`.
- A symbol in `'(|(| |)| [| |]| |{| |}|)` or `#f`.
- A number representing the starting position of the match (or `#f` if eof).
- A number representing the ending position of the match (or `#f` if eof).

```
(racket-lexer* in offset mode)
→ (or/c string? eof-object?)
   (or/c symbol?
         (and/c (hash/c symbol? any/c) immutable?))
   (or/c symbol? #f)
   (or/c number? #f)
   (or/c number? #f)
   exact-nonnegative-integer?
   any/c
in : input-port?
offset : exact-nonnegative-integer?
mode : any/c
```

Like `racket-lexer`, but uses the extended lexer protocol to track and report regions that are commented out with `#;`.

Added in version 1.2 of package `syntax-color-lib`.

```
(racket-lexer/status in) → (or/c string? eof-object?)
                           symbol?
                           (or/c symbol? #f)
                           (or/c number? #f)
                           (or/c number? #f)
                           (or/c 'datum 'open 'close 'continue)
in : input-port?
```

Like `racket-lexer`, but returns an extra value. The last return value indicates whether the consumed token should count as a datum, an opening parenthesis (or similar starting token to group other tokens), a closing parenthesis (or similar), or a prefix (such as whitespace) on a datum.

```
(racket-lexer*/status in offset mode)
→ (or/c string? eof-object?)
   (or/c symbol?
        (and/c (hash/c symbol? any/c) immutable?))
   (or/c symbol? #f)
   (or/c number? #f)
   (or/c number? #f)
   exact-nonnegative-integer?
   any/c
   (or/c 'datum 'open 'close 'continue)
in : input-port?
offset : exact-nonnegative-integer?
mode : any/c
```

Like `racket-lexer/status`, but with comment tracking like `racket-lexer*`.

Added in version 1.2 of package `syntax-color-lib`.

```
(racket-nobar-lexer/status in)
→ (or/c string? eof-object?)
   symbol?
   (or/c symbol? #f)
   (or/c number? #f)
   (or/c number? #f)
   (or/c 'datum 'open 'close 'continue)
in : input-port?
```

Like `racket-lexer/status`, except it treats `|` as a delimiter instead of quoting syntax for a symbol. This function is used by `scribble-lexer`.

```
(racket-nobar-lexer*/status in offset mode)
```

```
→ (or/c string? eof-object?)
   (or/c symbol?
         (and/c (hash/c symbol? any/c) immutable?))
   (or/c symbol? #f)
   (or/c number? #f)
   (or/c number? #f)
   exact-nonnegative-integer?
   any/c
   (or/c 'datum 'open 'close 'continue)
in : input-port?
offset : exact-nonnegative-integer?
mode : any/c
```

Like [racket-nobar-lexer/status](#), but with comment tracking like [racket-lexer*](#).

Added in version 1.2 of package `syntax-color-lib`.

4 Default Lexer

```
(require syntax-color/default-lexer)
package: syntax-color-lib

(default-lexer in) → (or/c string? eof-object?)
                    symbol?
                    (or/c symbol? #f)
                    (or/c number? #f)
                    (or/c number? #f)

in : input-port?
```

A lexer that only identifies `(`, `)`, `[`, `]`, `{`, and `}` built specifically for `color:text<%>`.

`default-lexer` returns 5 values:

- Either a string containing the matching text or the eof object. Block specials currently return an empty string. This may change in the future to other string or non-string data.
- A symbol in `'(comment white-space no-color eof)`.
- A symbol in `'(|(| |)| |[| |]| |{| |}|)` or `#f`.
- A number representing the starting position of the match (or `#f` if eof).
- A number representing the ending position of the match (or `#f` if eof).

5 Module Lexer

```
(require syntax-color/module-lexer)
      package: syntax-color-lib

(module-lexer in offset mode)
→ (or/c string? eof-object?)
  symbol?
  (or/c symbol? #f)
  (or/c number? #f)
  (or/c number? #f)
  exact-nonnegative-integer?
  (or/c #f
    (-> input-port? any)
    (cons/c (-> input-port? exact-nonnegative-integer?
              any/c
              any)
            any/c)
    (struct/c dont-stop
      ((cons/c (-> input-port?
                  exact-nonnegative-integer?
                  any/c
                  any)
                any/c))))))

in : input-port?
offset : exact-nonnegative-integer?
mode : (or/c #f
  (-> input-port? exact-nonnegative-integer?any)
  (cons/c (-> input-port?
            exact-nonnegative-integer?
            any/c
            any)
          any/c))
```

Like `racket-lexer`, but with several differences:

- The `module-lexer` function accepts an offset and lexer mode, instead of just an input port.
- In addition to the results of `racket-lexer`, `module-lexer` returns a backup distance and a new lexer mode.
- When `mode` is `#f` (indicating the start of the stream), the lexer checks `in` for a `#lang` specification.

If a `#lang` line is present but the specified language does not exist, the entire `in` input is consumed and colored as `'error`.

If the language exists and the language provides a `get-info` function, then it is called with `'color-lexer`. If the result is not `#f`, then it should be a lexer function for use with `color:text<%>`. The result mode is the lexer—paired with `#f` if the lexer is a procedure arity 3—so that future calls will dispatch to the language-supplied lexer.

If the language is specified but it provides no `get-info` or `'color-lexer` result, then `racket-lexer` is returned as the mode.

- When `mode` is a lexer procedure, the lexer is applied to `in`. The lexer's results are returned, plus the lexer again as the mode; if the lexer produces a hash-table attribute result, however, the `'type` value is extracted and returned in place of the hash table.
- When `mode` is a pair, then the lexer procedure in the `car` is applied to `in`, `offset`, and the mode in the `cdr`. The lexer's results are returned, except that its mode result is paired back with the lexer procedure.

```
(module-lexer* in offset mode)
→ (or/c string? eof-object?)
   (or/c symbol?
        (and/c (hash/c symbol? any/c) immutable?))
   (or/c symbol? #f)
   (or/c number? #f)
   (or/c number? #f)
   exact-nonnegative-integer?
   (or/c #f
         (-> input-port? any)
         (cons/c (-> input-port?
                    exact-nonnegative-integer?
                    any/c
                    any)
                 any/c)
         (struct/c dont-stop
                    ((cons/c (-> input-port?
                                exact-nonnegative-integer?
                                any/c
                                any)
                             any/c))))))
in : input-port?
offset : exact-nonnegative-integer?
mode : (or/c #f
           (-> input-port? any)
           (cons/c (-> input-port?
                      exact-nonnegative-integer?
                      any/c
                      any)
                   any/c))
```

Like `module-lexer`, except that the attribute result propagated from a language-specific lexer can be a hash table.

Added in version 1.2 of package `syntax-color-lib`.

6 Scribble Lexer

```
(require syntax-color/scribble-lexer)
package: syntax-color-lib

(scribble-lexer in offset mode)
→ (or/c string? eof-object?)
  (or/c symbol?
    (and/c (hash/c symbol? any/c) immutable?))
  (or/c symbol? #f)
  (or/c number? #f)
  (or/c number? #f)
  exact-nonnegative-integer?
  any/c
in : input-port?
offset : exact-nonnegative-integer?
mode : any/c
```

Like `racket-lexer*`, but for Racket extended with Scribble’s `@` notation (see §2 “@ Syntax”).

Changed in version 1.2 of package `syntax-color-lib`: Changed to be like `racket-lexer*` instead of `racket-lexer`.

```
(scribble-inside-lexer in offset mode)
→ (or/c string? eof-object?)
  (or/c symbol?
    (and/c (hash/c symbol? any/c) immutable?))
  (or/c symbol? #f)
  (or/c number? #f)
  (or/c number? #f)
  exact-nonnegative-integer?
  any/c
in : input-port?
offset : exact-nonnegative-integer?
mode : any/c
```

Like `scribble-lexer`, but starting in “text” mode instead of Racket mode.

Changed in version 1.2 of package `syntax-color-lib`: Changed to be like `racket-lexer*` instead of `racket-lexer`.

```
(make-scribble-lexer [#:command-char at]) → lexer/c
at : (and/c char? (not/c (or/c #\] #\[))) = #\@
```

Produces a lexer like `scribble-lexer`, but using `at` in place of `@`.

Added in version 1.1 of package `syntax-color-lib`.

Changed in version 1.2: Changed like `scribble-lexer`.

```
(make-scribble-inside-lexer [#:command-char at]) → lexer/c  
  at : (and/c char? (not/c (or/c #\] #\[))) = #\@
```

Produces a lexer function like `scribble-inside-lexer`, but using `at` in place of `@`.

Added in version 1.1 of package `syntax-color-lib`.

Changed in version 1.2: Changed like `scribble-lexer`.

7 Splay Tree for Tokenization

```
(require syntax-color/token-tree)
package: syntax-color-lib
```

```
token-tree% : class?
superclass: object%
```

A splay-tree class specifically geared for the task of on-the-fly tokenization. Instead of keying nodes on values, each node has a length, and they are found by finding a node that follows a certain total length of preceding nodes.

FIXME: many methods are not yet documented.

```
(new token-tree% [len len] [data data])
→ (is-a?/c token-tree%)
len : (or/c exact-nonnegative-integer? false/c)
data : any/c
```

Creates a token tree with a single element.

```
(send a-token-tree get-root) → (or/c node? #f)
```

Returns the root node in the tree.

```
(send a-token-tree search! key-position) → void?
key-position : natural-number/c
```

Splays, setting the root node to be the closest node to offset *key-position* (i.e., making the total length of the left tree at least *key-position*, if possible).

```
(node? v) → boolean?
v : any/c
(node-token-length n) → natural-number/c
n : node?
(node-token-data n) → any/c
n : node?
(node-left-subtree-length n) → natural-number/c
n : node?
(node-left n) → (or/c node? #f)
n : node?
(node-right n) → (or/c node? #f)
n : node?
```

Functions for working with nodes in a `token-tree%`.

```
(insert-first! tree1 tree2) → void?  
  tree1 : (is-a?/c token-tree%)  
  tree2 : (is-a?/c token-tree%)
```

Inserts `tree1` into `tree2` as the first thing, setting `tree2`'s root to `#f`.

```
(insert-last! tree1 tree2) → void?  
  tree1 : (is-a?/c token-tree%)  
  tree2 : (is-a?/c token-tree%)
```

Inserts `tree1` into `tree2` as the last thing, setting `tree2`'s root to `#f`.

```
(insert-last-spec! tree n v) → void?  
  tree : (is-a?/c token-tree%)  
  n : natural-number/c  
  v : any/c
```

Same as

```
(insert-last! tree  
  (new token-tree%  
    [length n]  
    [data v]))
```

This optimization is important for the colorer.

8 Interface for Clients of Syntax Color Output

```
(require syntax-color/color-textoid)
package: syntax-color-lib
```

Added in version 1.3 of package `syntax-color-lib`.

```
| color-textoid<%> : interface?
```

The `color-textoid<%>` interface matches a subset of the `color:text<%>` interface. It specifies methods that indentation and expression-navigation functions can use so that they work either on actual `color:text<%>` objects or in other environments that use the `start-colorer` in `color:text<%>` protocol without `racket/gui`.

```
| (send a-color-textoid get-text [start end]) → string?
  start : exact-nonnegative-integer? = 0
  end : (or/c exact-nonnegative-integer? 'eof) = 'eof
```

Like `get-text` in `text%`.

```
| (send a-color-textoid get-character start) → char?
  start : exact-nonnegative-integer?
```

Like `get-character` in `text%`.

```
| (send a-color-textoid last-position)
  → exact-nonnegative-integer?
```

Like `last-position` in `text%`.

```
| (send a-color-textoid position-paragraph start
                                     [at-eol?])
  → exact-nonnegative-integer?
  start : exact-nonnegative-integer?
  at-eol? : any/c = #f
```

Like `position-paragraph` in `text%`.

```
| (send a-color-textoid paragraph-start-position paragraph
                                     [visible?])
  → exact-nonnegative-integer?
  paragraph : exact-nonnegative-integer?
  visible? : any/c = #t
```

Like `paragraph-start-position` in `text%`.

```
(send a-color-textoid paragraph-end-position paragraph
                                     [visible?])
→ exact-nonnegative-integer?
   paragraph : exact-nonnegative-integer?
   visible? : any/c = #t
```

Like `paragraph-end-position` in `text%`.

```
(send a-color-textoid skip-whitespace position
                                     direction
                                     comments?)
→ exact-nonnegative-integer?
   position : exact-nonnegative-integer?
   direction : (or/c 'forward 'backward)
   comments? : boolean?
```

Like `skip-whitespace` in `color:text<%>`.

```
(send a-color-textoid backward-match position
                                     cutoff)
→ (or/c exact-nonnegative-integer? #f)
   position : exact-nonnegative-integer?
   cutoff : exact-nonnegative-integer?
```

Like `backward-match` in `color:text<%>`.

```
(send a-color-textoid backward-containing-sexp position
                                               cutoff)
→ (or/c exact-nonnegative-integer? #f)
   position : exact-nonnegative-integer?
   cutoff : exact-nonnegative-integer?
```

Like `backward-containing-sexp` in `color:text<%>`.

```
(send a-color-textoid forward-match position
                                     cutoff)
→ (or/c exact-nonnegative-integer? #f)
   position : exact-nonnegative-integer?
   cutoff : exact-nonnegative-integer?
```

Like `forward-match` in `color:text<%>`.

```
(send a-color-textoid classify-position position)
→ (or/c symbol? #f)
   position : exact-nonnegative-integer?
```

Like `classify-position` in `color:text<%>`.

```
(send a-color-textoid classify-position* position)
→ (or/c (and/c (hash/c symbol? any/c) immutable?) #f)
   position : exact-nonnegative-integer?
```

Like `classify-position*` in `color:text<%>`.

```
(send a-color-textoid get-token-range position)
→ (or/c #f exact-nonnegative-integer?)
   (or/c #f exact-nonnegative-integer?)
   position : exact-nonnegative-integer?
```

Like `get-token-range` in `color:text<%>`.

```
(send a-color-textoid get-backward-navigation-limit start)
→ exact-integer?
   start : exact-integer?
```

Like `get-backward-navigation-limit` in `color:text<%>`.

```
(send a-color-textoid get-regions)
→ (listof (list/c exact-nonnegative-integer? (or/c exact-nonnegative-integer? 'end)))
```

Like `get-regions` in `color:text<%>`.

9 Racket S-Expression Indentation and Navigation

The "syntax-color" collection provides Racket indentation and navigation functions that take advantage of the token categories and parenthesis information produced by a coloring lexer. They can work with any object that implements `color-textoid<%>`, which is extended by `color:text<%>`.

Added in version 1.3.

9.1 S-Expression Navigation

```
(require syntax-color/racket-navigation)
package: syntax-color-lib
```

```
(racket-forward-sexp text pos)
→ (or/c #f exact-nonnegative-integer?)
text : (is-a?/c color-textoid<%>)
pos : exact-nonnegative-integer?
(racket-backward-sexp text pos)
→ (or/c #f exact-nonnegative-integer?)
text : (is-a?/c color-textoid<%>)
pos : exact-nonnegative-integer?
(racket-up-sexp text pos) → (or/c #f exact-nonnegative-integer?)
text : (is-a?/c color-textoid<%>)
pos : exact-nonnegative-integer?
(racket-down-sexp text pos)
→ (or/c #f exact-nonnegative-integer?)
text : (is-a?/c color-textoid<%>)
pos : exact-nonnegative-integer?
```

Each of these functions takes a position `pos` within `text` and returns a position corresponding to S-expression movement. The result is `#f` if no movement in the corresponding direction is possible.

```
(racket-stick-to-next-sexp? text pos) → boolean?
text : (is-a?/c color-textoid<%>)
pos : exact-nonnegative-integer?
```

Returns whether the content at `pos` in `text` corresponds to a token that should “stick” to the following parenthesized sequence for navigation purposes. For example, the result is `#t` when the token corresponds to `!`, `!`, or `#!`.

9.2 S-Expression Indentation

```
(require syntax-color/racket-indentation)
package: syntax-color-lib

(racket-amount-to-indent text
  pos
  [#:head-sexp-type head-sexp-type]
  #:graphical-width graphical-width)
→ (or/c #f exact-nonnegative-integer?)
text : (is-a?/c color-textoid<%>)
pos : exact-nonnegative-integer?
head-sexp-type : (string?
  . -> .
  (or/c #f 'lambda 'define 'begin 'for/fold 'other))
= (racket-tabify-table->head-sexp-type
  racket-tabify-default-table)
graphical-width : (or/c #f (-> (is-a?/c color-textoid<%>)
  exact-nonnegative-integer?
  exact-nonnegative-integer?
  (or/c #f exact-nonnegative-integer?)))
```

Returns an amount of indentation to use for the line in *text* that contains the position *pos*. The result may be more or less than the current amount of indentation on the line.

The *head-sexp-type* function is used to map identifiers at the start of an S-expression to the indentation rule that the identifier should use. See [compute-racket-amount-to-indent](#) in `racket:text<%>` for more information.

The *graphical-width* function is used to get the graphical width (distance between the “x” coordinates) of content in *text* between a start and end position. If *graphical-width* returns *#f*, then characters in *text* are assumed to be all the same width. If *graphical-width* is *#f*, it is treated the same as if it had been `(λ (t start end) #f)`.

Changed in version 1.5 of package `syntax-color-lib`: Allow *graphical-width* to return *#f*.

```
(racket-tabify-table->head-sexp-type spec)
→ (string? . -> . (or/c #f 'lambda 'define 'begin 'for/fold 'other))
spec : (list/c (hash/c symbol? (or/c 'lambda 'define 'begin 'for/fold))
  (or/c #f regexp?)
  (or/c #f regexp?)
  (or/c #f regexp?)
  (or/c #f regexp?))
```

Converts a serializable representation *spec* of an indentation configuration to a function suitable for use with `racket-amount-to-indent`.

The first element of *spec* maps individual symbols to indentation styles. The remaining elements provide patterns to recognize identifiers with the corresponding style, in the order 'lambda, 'define, 'begin, and 'for/fold.

```
racket-tabify-default-table
: (list/c (hash/c symbol? (or/c 'lambda 'define 'begin 'for/fold))
          (or/c #f regexp?)
          (or/c #f regexp?)
          (or/c #f regexp?)
          (or/c #f regexp?))
```

A default configuration suitable as an argument to `racket-tabify-table->head-sexp-type`.
